

Bayes' theorem

$$P(\text{parameters} \mid \text{data, model}) = \frac{\overset{\text{likelihood}}{P(\text{data} \mid \text{parameters, model})} \overset{\text{priors}}{P(\text{parameters} \mid \text{model})}}{P(\text{data} \mid \text{model})}$$

marginal probability of the data

Putting everything together

posterior

$$P(\text{tree, flower, } \lambda, \mu, \rho, \text{substitution model, clock model} \mid \text{data}) =$$

probability of the character
data given everything else*

probability of the timetree
given the tree model

priors on
fossil ages

priors on model parameters

$$\frac{P(\text{data} \mid \text{tree, flower, } \lambda, \mu, \rho, \text{substitution model, clock model}) P(\text{tree} \mid \text{flower, } \lambda, \mu, \rho) P(\text{flower}) P(\lambda) P(\mu) P(\rho) P(\text{substitution model}) P(\text{clock model})}{P(\text{data})}$$

marginal probability of the data

*the tree, the parameters and the tripartite model
